Part 1 Data Processing and Engineering

December 20, 2021

1 Predict Future Sales Part 1: Data Processing and Engineering

Motivation

This is the final project for the course "How to win a data science competition". In this competition you will work with a challenging time-series dataset consisting of daily sales data, kindly provided by one of the largest Russian software firms - 1C Company.

We are asking you to **predict total sales for every product and store in the next month**. By solving this competition you will be able to apply and enhance your data science skills.

You are provided with daily historical sales data. The task is to forecast the total amount of products sold in every shop for the test set. **Note that the list of shops and products slightly changes every month.** Creating a robust model that can handle such situations is part of the challenge.

Source: https://www.kaggle.com/c/competitive-data-science-predict-future-sales/overview

File Description - sales_train.csv - the training set. Daily historical data from January 2013 to October 2015. - test.csv - the test set. You need to forecast the sales for these shops and products for November 2015. - sample_submission.csv - a sample submission file in the correct format. - items.csv - supplemental information about the items/products. - item_categories.csv - supplemental information about the items categories. - shops.csv- supplemental information about the shops.

2 Table of contents

- 1. Importing data
- 2. Preprocessing data
 - 2.1 Extracting categorical features from Russian item names
 - 2.2 Creating text features with TF-IDF
 - 2.3 Check duplicates
 - 2.4 Preprocessing for data engineering
 - 2.5 Create lagged features
 - 2.6 Creating time series trend features
 - 2.7 Feature matrix
- 3. Exploratory data analysis
 - 3.1 Target variable
 - 3.2 Multivariate heatmaps
- 4. Advancedd Feature Engineering

- 4.1 Mean encoding on categorical features
- 4.2 Matrix factorization of TFIDF processed features

```

4.5 2.5 Create lagged features

We want to capture past behavior of several item-shop, item category-shop or item-city pairings (among others):

- date_avg_item_cnt
- date item avg item cnt
- $\bullet \quad date_shop_avg_item_cnt$
- date cat avg item cnt
- $\bullet \quad date_shop_cat_avg_item_cnt$
- date shop subtype avg item cnt
- date city avg item cnt
- \bullet date_shop_type_avg_item_cnt
- date item city avg item cnt
- \bullet date_type_avg_item_cnt
- $\bullet \quad date_subtype_avg_item_cnt$

```

5 3. Exploratory data analysis

5.1 3.1 Target variable

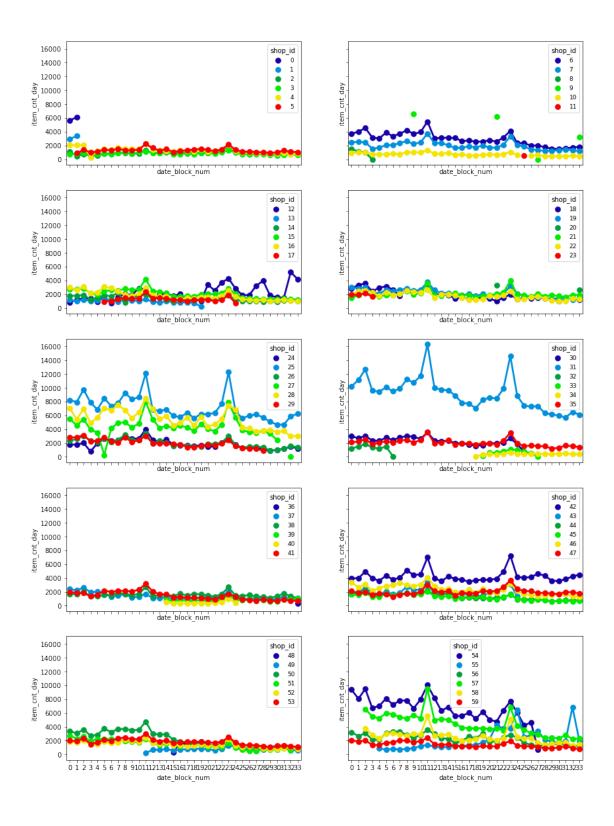

The **target variable** to be predicted is **item_cnt_month**. Let's check its time series evolution and KDE distribution.

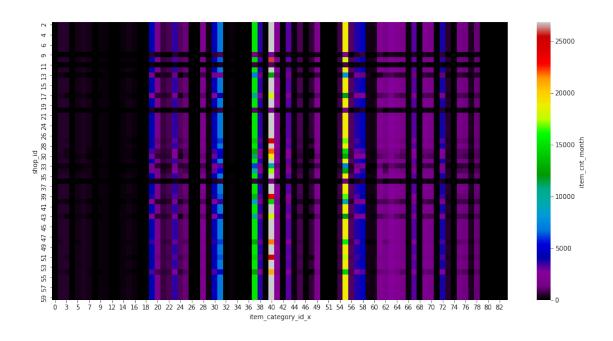

Now check the monthly performance of each shop:

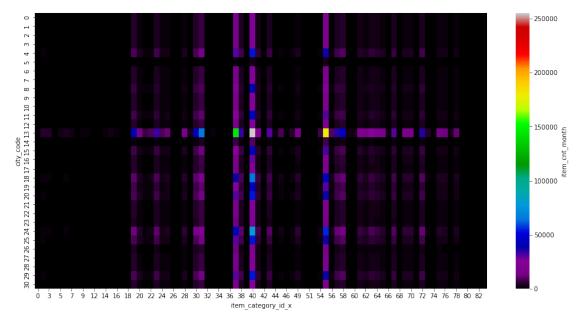

5.2 3.2 Multivariate heatmaps

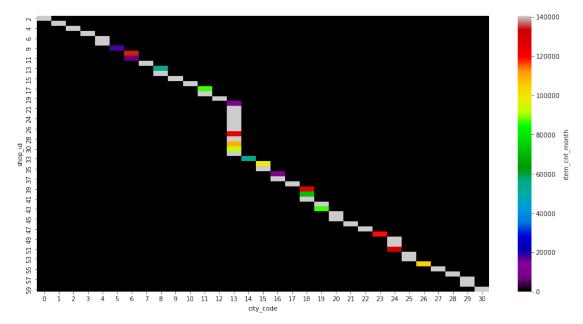

We can pari different categorical variables (ex. item_category_id, shop_id, city_code) together and check the performance of different pairs.

```
[59]: #pair (item_category_id, shop_id)
      stores hm = df.pivot table(index='shop id', columns='item category id x', |
      →values='item_cnt_month', aggfunc='count', fill_value=0)
      stores_hm.head()

                                                                 92
      [5 rows x 80 columns]
[60]: fig, ax = plt.subplots(figsize=(16, 8))
      sns.heatmap(stores_hm, cmap='nipy_spectral', ax=ax, cbar=True,_
```

The next figure reveals the number of shops per cities and their sales performance.

Several pairs of shop-item perform better than others, let's exploit this by using target/mean encodings.

6 4. Advancedd Feature Engineering

6.1 4.1 Mean encoding on categorical features

Mean encodings look to map a high cardinality categorical feature into a 1D array (instead of high numbers of them had we used one-hot encoding) based on how often the target variable appears on average in the categorical feature. It is a convenient approach since it also has a clever way of imputing missing values among categorical variables.

```
[45]: import copy
[63]: df1 = copy.copy(df)
    df1.reset_index(inplace=True)
    cv = KFold(n_splits=5, shuffle=False)
```

```
check = False
      for train_idx, valid_idx in cv.split(df1):
          # Train/validation split
          X_train, X_valid = df1.iloc[train_idx,:], df1.iloc[valid_idx,:]
          #Mean encoding
          #cat_features = ['shop_id', 'item_id', 'city_code',
          #'item_category_id_x', 'type_code', 'subtype_code']
          for col in cat_features:
              means = X_valid[col].map(X_train.groupby(col).item_cnt_month.mean()) #
              col_new = col + '_target_enc'
              X_valid[col_new] = means
              #results
              df1.loc[valid_idx, col_new] = X_valid
              #store new columns
              if check is False:
                  new_features.append(col_new)
          check = True
      print(new features)
      # df1.head()
